

PRODUCTS & SERVICES

- Customized well water systems - let us customize a system for your specific need
- Water softening systems
- Reverse osmosis systems
- Sprinkler filtration systems - no more ugly sprinkler stains
- Chlorine sales and service
- Salt/potassium sales and service

Until now, consumers had only two options for purchasing a water purification system: "big box" stores offering lower-end equipment, or in-home salespeople using high-pressure tactics to sell a system that may not provide the appropriate solution. Bimini Pure Water believes you should have a real option – the best quality equipment, a customized system designed specifically for your requirements, and professional after-the-sale service. We give you the facts you need to reach an informed decision and be satisfied that you made the right choice.

CITY WATER APPLICATIONS

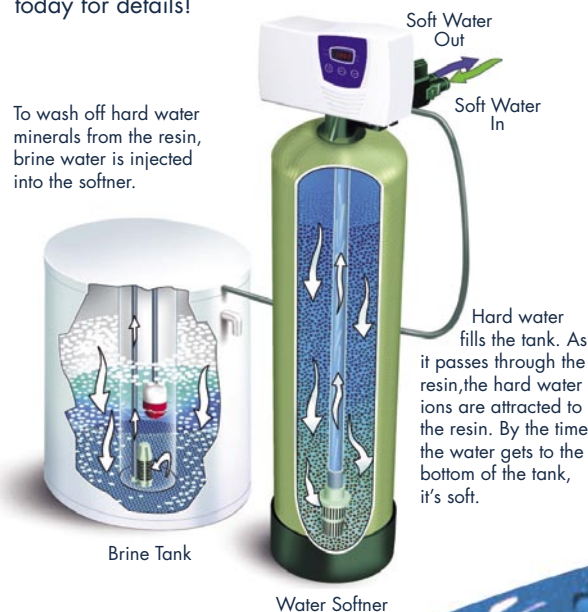

Hard water can hit you - and your pocket - hard. It works against you in most indoor uses, such as bathing, washing dishes and shaving. It can clog plumbing in appliances, cutting down on efficiency while increasing energy and maintenance bills. A Bimini water softener removes the materials that make your water hard.

Choose from among our wide selection of water softeners for the one that best suits your needs.

Treated city water means less housework and more enjoyable living:

- Cleaner sinks, bathtubs, fixtures and tile
- Cleaner, brighter laundry
- Less time spent scrubbing the kitchen and bathroom
- Softer, smoother skin and shinier hair
- Less soap, shampoo, and detergent use
- Water heating bills reduced by up to 29%

Bimini Pure Water offers service after the sale. Let us maintain your softener and deliver your salt. Call today for details!

WELL WATER APPLICATIONS

Do you have a rotten egg (sulfur) smell in your home? Is there a metallic taste to your water? Calcium build-up or iron stains in your kitchen or bathroom sinks?

The issues listed above are among the many that can occur with well water. Properly conditioning well water requires a multi-stage process that no single unit is capable of performing – despite what you may have been told. Bimini Pure Water will assess your situation and offer cost-effective solutions.

CONDITIONING WELL WATER

It begins with a sand trap to catch any sand brought up from the well. The water is then pushed into the Chlorinator, which introduces chlorine to kill bacteria. The chlorinated water is channeled into an 80-gallon holding tank to increase the oxygenation process. The chlorinated water passes through the filtration system, expelling the remains of the chlorine – leaving you with pure hard water. The water is rushed through the brine tank and into the softener, giving you the added benefit of soft water – which prolongs the life of your piping, fixtures and appliances.

It just doesn't get any better than this!
